**GBIF VOCABULARIES**

Vocabularies    Extensions    Log In    Help

This site provides mapping tools for a range of community-supported Vocabularies and Darwin Core Extensions. Vocabularies act as standardized multilingual thesauri which can be accessed and edited through a user interface as well as through XML (RESTful) web services and text (TSV & CSV) files from this site. Based on internationally recognized standards (e.g. ISO and TDWG) these vocabularies form a core component of all biodiversity data and are intended to facilitate the integration and harmonization of distributed datasets such as museum and GBIF collection records, data for the EOL and databases like the EDIT Scratchpads.

## Welcome

# Ontologías

An ontology is a way to represent knowledge, by describing the types or classes of entities within a given domain and the relationships among them. By providing standardized definitions for the terms used by scientists to represent these classes, and by defining the logical relationships among these terms, ontologies make information about content explicit for computers, allowing them to discover common meaning in diverse data sets. Thus, ontologies are an important component of many bioinformatics applications (Jensen and Bork, 2010), and they form the foundation of the semantic web (Berners-Lee et al.,

- *Premise of the study:* Bio-ontologies are essential tools for accessing and analyzing genomic and phenomic data. Ontologies provide structured vocabularies to support comparative analyses and reasoning. They are a key component of a framework for automated analyses and reasoning. They are a key component of a framework for automated analyses and reasoning.
- *Methods:* This paper provides background on what bio-ontologies are, why they are useful, and how they can be used in plant science. It includes an overview of ontologies and related resources, and a detailed description of the Plant Ontology (PO). We discuss the challenges of building an ontology for plants (Viridiplantae).
- *Key results:* Ontologies can advance plant science in four key areas: (1) comparative genomics; (2) taxonomy and systematics; (3) semantic applications; and (4) phenomics.
- *Conclusions:* Bio-ontologies offer a flexible framework for comparative plant science. As genomic and phenomic data become available for more species, the need for centralized databases will increase, while at the same time, the need for decentralized databases will also increase, causing more researchers in plant science to turn to ontologies.

**Key words:** bio-ontologies; genome annotation; OBO Foundry; phenomics; plant biology; plant systematics; semantic web.

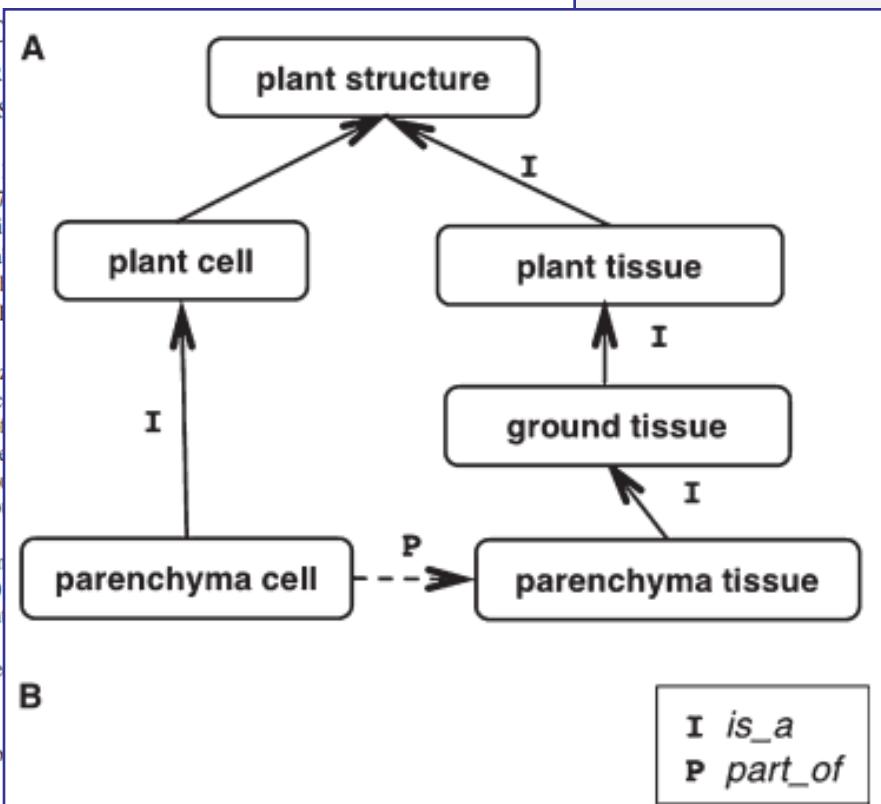

TABLE 1. Ontologies and other related resources for plant science.

Resource (abbreviation)	Domain	References
Plant Ontology (PO)	Plant anatomical entities and plant structure development stages	(Pujar et al., 2006; Ilie et al., 2007)
Gene Ontology (GO)	Cellular components, biological processes, and molecular functions	(Gene Ontology Consortium, 2009) <a href="http://www.geneontology.org/">http://www.geneontology.org/</a>
Chemical Entities of Biological Interest (ChEBI)	Molecular entities that are natural products or are synthetic products used to intervene in the processes of living organisms	(Degtyarenko et al., 2007; de Matos et al., 2009) <a href="http://www.ebi.ac.uk/chebi/">http://www.ebi.ac.uk/chebi/</a>
Protein Ontology (PR)	Proteins based on evolutionary relatedness, protein forms produced from a given gene locus, and protein-containing complexes	(Natale et al., 2007; Bult et al., 2011) <a href="http://pir.georgetown.edu/pro/">http://pir.georgetown.edu/pro/</a>
Ontology for Biomedical Investigations (OBI)	Scientific investigations, including the protocols and instrumentation used, the material used, the data generated, and the types of analysis performed	(Brinkman et al., 2010) <a href="http://obi-ontology.org">http://obi-ontology.org</a>
Phenotypic Quality Ontology (PATO)	Phenotypic qualities (properties). This ontology can be used in conjunction with other ontologies such as anatomical ontologies to refer to phenotypes.	(Mungall et al., 2010) <a href="http://obofoundry.org/wiki/index.php/PATO:Main_Page">http://obofoundry.org/wiki/index.php/PATO:Main_Page</a>
Plant Trait Ontology (TO)	Phenotypic traits in plants; each trait is a distinguishable feature, characteristic, or quality of a plant	(Jaiswal, 2011) <a href="http://www.gramene.org/db/ontology/search?id=TO:0000387">http://www.gramene.org/db/ontology/search?id=TO:0000387</a>
Plant Infectious Disease Ontology (IDOPlant)	Plant infectious diseases, pathogens, and symptoms	(Walls et al., in press) <a href="http://purl.obolibrary.org/obo/idoplant.owl">http://purl.obolibrary.org/obo/idoplant.owl</a> .
Extensible Observation Ontology (OBOE)	A suite of ontologies for modeling and representing scientific observations	(Madin et al., 2007) <a href="https://semttools.ecoinformatics.org/oboe">https://semttools.ecoinformatics.org/oboe</a>
Environment Ontology (EnvO)	Environmental features and habitats	<a href="http://environmentontology.org/">http://environmentontology.org/</a>
NCBI Taxonomy	Biological taxa, based on the classification of the National Center for Biotechnology Information	(Wheeler et al., 2007) <a href="http://obofoundry.org/cgi-bin/detail.cgi?id=ncbi_taxonomy">http://obofoundry.org/cgi-bin/detail.cgi?id=ncbi_taxonomy</a>
BioPortal Ontology Lookup Service	Source for finding, searching and querying bio-ontologies	<a href="http://bioportal.bioontology.org/">http://bioportal.bioontology.org/</a>
OntoBee	Source for finding and searching bio-ontologies	(Côté et al., 2006) <a href="http://www.ebi.ac.uk/ontology-lookup/">http://www.ebi.ac.uk/ontology-lookup/</a> (Xiang et al., 2011) <a href="http://ontobee.org">http://ontobee.org</a>

# Ontologías hoy

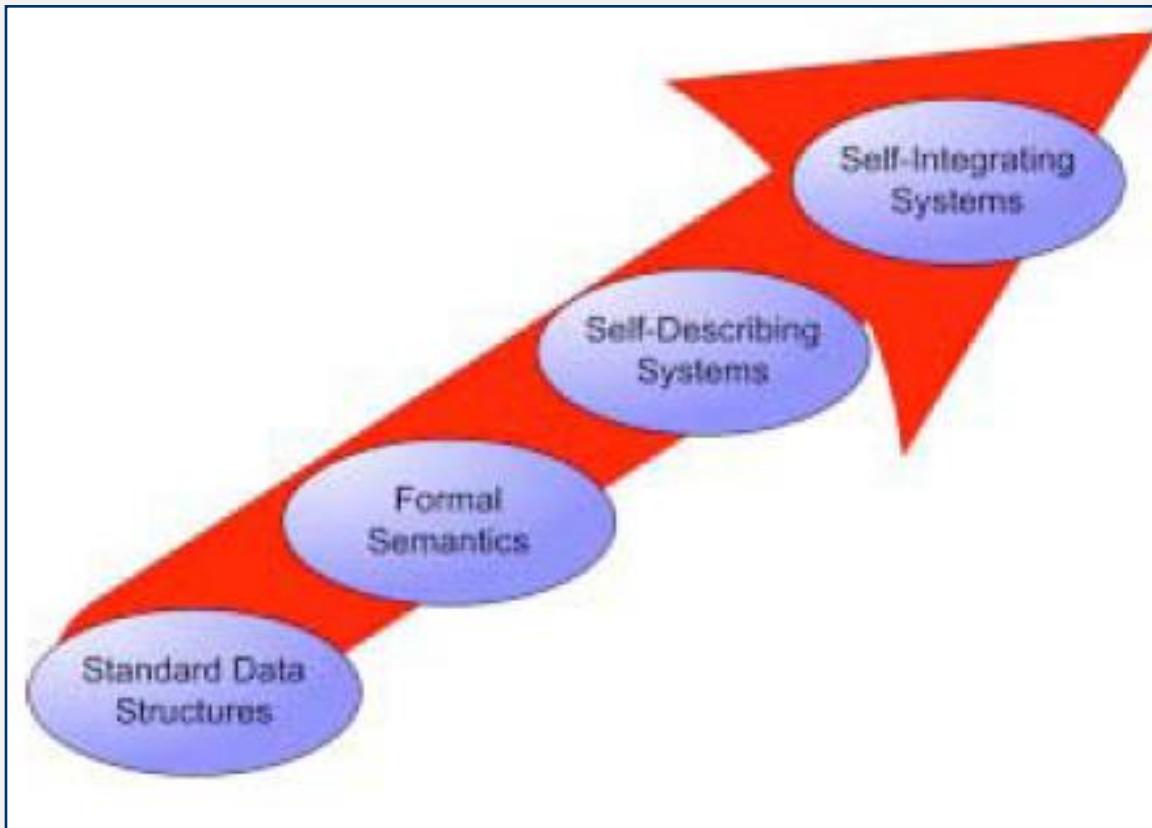

- Retos:
  - Falta de vocabularios completos que cubran grupos amplios de organismos (p.e. plantas)
  - No todas las entidades observables pueden adscribirse “limpiamente” a las categorías establecidas (p.e. que es un septo de un fruto)
  - Homologías discutibles
  - Pérdida de detalle en las generalizaciones
  - Etc.

# Web semántica: navegar los datos como el metro de una ciudad

- Bases de datos conectadas por ontologías y la Web
- Conseguir que podamos inferir hechos a partir de datos distribuidos

# Hacia donde vamos

La idea es que la web funciona como un único sistema de información

# XML

Los contenidos se tienden a codificar usando un metalenguaje llamado XML (Extensible markup Language).

La definiciones y relaciones se expresan usando una implementación de XML llamada XSD (*XML Schema Definition*)

# Web semántica en acción: “Linked (open) data”

## ¿Qué es Linked Data?

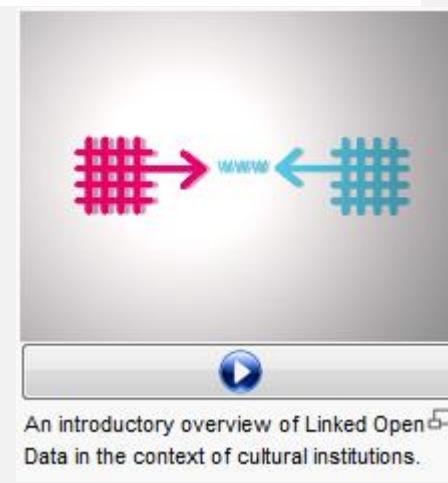

Los Datos Enlazados es la forma que tiene la [Web Semántica](#) de vincular los distintos datos que están distribuidos en la Web, de forma que se referencian de la misma forma que lo hacen los enlaces de las páginas web.

La Web Semántica no se trata únicamente de la publicación de datos en la Web, sino que éstos se pueden vincular a otros, de forma que las personas y las máquinas puedan explorar la web de los datos, pudiendo llegar a información relacionada que se hace referencia desde otros datos iniciales.

## ¿Cómo funciona?

Los Datos Enlazados, como parte de la Web Semántica, se basa en la aplicación de ciertos principios básicos y necesarios, que fomentarán el crecimiento de la Web, tanto a nivel de los documentos [HTML](#) (vista clásica de la Web), como a nivel de los datos expresados en [RDF](#) (vista de la Web Semántica).

1. Usar URIs para identificar las cosas
2. Usar URIs HTTP
3. Ofrecer información sobre los recursos usando RDF
4. Incluir enlaces a otros URIs

# Linked Data and the Charm of Weak Semantics

## Introduction: The Strengths of Weak Semantics

by Thomas Baker and Stuart A. Sutton

## Linked Data and the Charm of Weak Semantics

### EDITOR'S SUMMARY

Logic and precision are fundamental to ontologies underlying the semantic web and, by extension, to linked data. This special section focuses on the interaction of semantics, ontologies and linked data. The discussion presents the Simple Knowledge Organization Scheme (SKOS) as a less formal strategy for expressing concept hierarchies and associations and questions the value of deep domain ontologies in favor of simpler vocabularies that are more open to reuse, albeit risking illogical outcomes. RDF ontologies harbor another unexpected drawback. While structurally sound, they leave validation gaps permitting illogical uses, a problem being addressed by a W3C Working Group. Data models based on RDF graphs and properties may replace traditional library catalog models geared to predefined entities, with relationships between RDF classes providing the semantic connections. The BIBFRAME Initiative takes a different and streamlined approach to linking data, building rich networks of information resources rather than relying on a strict underlying structure and vocabulary. Taken together, the articles illustrate the trend toward a pragmatic approach to a Semantic Web, sacrificing some specificity for greater flexibility and partial interoperability.

ontologies

Thomas Baker, an organizer of the Dublin Core Metadata Initiative, is an associate professor at Sungkyunkwan University in Seoul, South Korea. He can be reached at [tb12<at>tbaker.org](mailto:tb12<at>tbaker.org).

Stuart A. Sutton, associate professor emeritus in the Information School of the University of Washington, is managing director of the Dublin Core Metadata Initiative. He can be reached at [sasutton<at>uw.edu](mailto:sasutton<at>uw.edu).

**W**hen the meme first emerged in the late 1990s, *Semantic Web* stood for logical data processing on the foundation of World Wide Web technology. One of its roots reached back to the 1955 meme of *artificial intelligence*, with its notion “that every aspect of learning or any other feature of intelligence can in principle be so precisely described that a machine can be made to simulate it.” [1, p. 12] The Semantic Web specifications developed by the World Wide Web Consortium from the late 1990s through the mid-2000s – the Resource Description Framework (RDF) and the Web Ontology Language (OWL) – were anchored in the notion of *ontology* as a “formal, explicit specification of a shared conceptualization” as supported by the field of ontology engineering.

Around 2006, Semantic Web was joined by the related, but more accessible and ultimately more popular meme of *linked data*. Starting with a cluster of databases linked to and from Wikipedia, the linked data movement took a more inclusive view of data technologies, with data serialized for Semantic Web-based interoperability as the five-star summit that providers of data in proprietary or application-specific document, database and record formats could by incremental steps ascend.

The contributions to this issue of the *Bulletin of the Association for Information Science and Technology* address, from five perspectives, how the shift to the idea of linked data at scale has changed the role of semantically precise ontologies.

As Oscar Corcho, María Poveda-Villalón and Asunción Gómez-Pérez see it, linked data has put the field of ontology engineering into a new context. Where tradition has favored heavyweight ontologies that demonstrate deep understanding of a domain and enable sophisticated inferences, the

## Herbarium Berolinense

Occurrence dataset published by Botanic Garden and Botanical Museum Berlin-Dahlem

Information Stats Activity

Huge dataset

### Summary

#### FULL TITLE

Herbarium Berolinense

#### DESCRIPTION

The herbarium of the Botanic Garden and Botanical Museum Berlin-Dahlem (herbarium acronym: B) is the largest in Germany and holds a collection of more than 3.5 million preserved specimens. All plant groups – flowering plants, ferns, mosses, liverworts, and algae, as well as fungi and lichens – are represented in the collections which are worldwide in scope. Associated with the general herbarium are special collections of dried fruits and seeds, wood samples, and specimens preserved in alcohol. The collections of the herbarium are growing constantly through field research conducted by staff, and through gifts, acquisitions, and exchanges of specimens from other herbaria

## Webservice API

version v1

Summary Registry Species Occurrence Maps News

### Introduction

The GBIF API provides registration, discovery and access and information services.

The API is a RESTful JSON based API. The base URL for v1 you should use is:

- <http://api.gbif.org/v1/>

The API is split into logical sections to ease understanding:

- **Registry:** Provides means to create, edit, update and search for information about the datasets, organizations (e.g. data publishers), networks and the means to access them (technical endpoints). The registered content controls what is crawled and indexed in the GBIF data portal, but as a shared API may also be used for other initiatives
- **Species:** Provides services to discover and access information about species and higher taxa, and utility services for interpreting names and looking up the identifiers and complete scientific names used for species in the GBIF portal.
- **Occurrence:** Provides access to occurrence information crawled and indexed by GBIF and search services to do real time paged search and asynchronous download services to do large batch downloads.
- **Maps:** Provides simple services to show the maps of GBIF mobilized content on other sites.
- **News:** Provides services to stream useful information such as papers published using GBIF mobilized content for various themes

# Lo nuevo en 4UCOLL

1. Soporte para web semántica: identificadores persistentes: PURLS, UUIDs
2. Soporte para cumplir con el Protocolo de Nagoya
3. Nuevo interfaz, navegación por “Ribbon”
4. Soporte para códigos QR
5. Exportación de datos en Darwin Core Archive
6. Múltiples mejoras en toda la aplicación

# Soporte para web semántica: identificadores persistentes

The image shows a Microsoft Access application interface with several tables open:

- ESPEC**: A table with columns **OcurrenceID** and **NHERBA**. It contains specimen IDs like 11ED152A-AD41-4D6C-8512-B69FBECBFE2D, A4BB5EF3-5D93-486F-8897-095A44F1BA2C, etc.
- M\_METADATA**: A table with columns **UUID** and **Id**. It lists various UUIDs such as 140-876n-436p-884h-954k, 195p-708h-617i-192n-356h, etc.
- LOTES\_ADJUNTOS**: A table with columns **UUID** and **CARPETA**. It shows a file path C:\Users\mcarmen.GBIF\Documents\katia1.pdf associated with a specific UUID.
- Lotes**: A table with columns **UUId**, **ESTANTERIA**, **COLECTI**, **RESPONSABL**, **CON\_E**, and **CON\_NCOL**. It lists items like P3/A5/E2/C1 Test, P3/A5/E1/C2/b Test, etc.
- QR\_Code**: A separate window displaying a table with columns **uuid** and **purl**. It lists persistent URLs corresponding to the UUIDs in the M\_METADATA table.

# Soporte para cumplir con el Protocolo de Nagoya

- 1.- Los **ejemplares** catalogados reciben un **identificador** único, global, persistente y resolvable, que permite su **referencia** y su **trazabilidad** hasta el origen.
- 2.- La aplicación permite asociar a cada **ejemplar** o lotes de ejemplares documentación; en este contexto, **PICs, MTAs MATs**.: pdf, hiperenlaces, imágenes...
- 3.- Las **hojas de envío** de material por las que se transfiere e intercambian ejemplares entre instituciones llevan un **texto de referencia** sobre como manejar y referenciar el material de acuerdo con Nagoya y las recomendaciones de CETAF:

<https://www.cbd.int/abs/submissions/icnp-3/EU-Taxonomic-practices.pdf>

# Nuevo interfaz, navegación por “Ribbon”

The image displays four horizontal ribbon bars, each representing a different section of the new interface:

- Fichado:** Shows icons for adding/editing specimens, rapid entry, scientific names, batch processing, and localities.
- Sistemas de información:** Shows icons for opening requests, managing expired requests, ignoring requests, center reliability, and more.
- Préstamos:** Shows icons for adding/validating loans, certificates, and managing loans.
- Consultas y listados:** Shows icons for general queries, advanced queries by gender, what, interval between two numbers, single catalog, location queries, and detecting revisions.

# Soporte para códigos QR

Hortus Regius Matritensis (MA-Fungi)

*Battarrea stevenii* (Libosch.) Fr.

ESP. Córdoba: carretera Comarcal 437 km 2,8; 30SUG4092; 05/10/1994; *S. Capello*, Det.: S. Capello.

MA-Fungi 35883

# Exportación de datos en Darwin Core Archive

Internet

## Exportaciones a Internet

1.- Seleccione el formato de Internet:

- para KML
- para Darwin Core Archive

2.- Filtrar excluidos:

3.- Exportar datos:

Generar Xml para purl.org

- PURL genérico
- PURL HZF para internet
- PURL sin página web

Crear Xml para purls

Configurar acceso a datos de

Ver historial de
